Project 2 Report:

1) I had problems debugging my dynamic arrays. I figured out how to use a debugger which helped me fix them.
2) There are no known bugs or incomplete aspects of my project.
3) I did not have any interactions outside of looking at the Piazza boards.
4) I used stack exchange and cplusplus.com as references throughout my code. 100% of my code is created from scratch (I did not copy/paste anything except the prime.cc file provided).

One limitation of this program is that month names used in the 'range' query must have their first letter capitalized. If it is in lower-case it will not work.
